Dr mahdiyeh lashkarizadeh

surgical&clinical pathologist

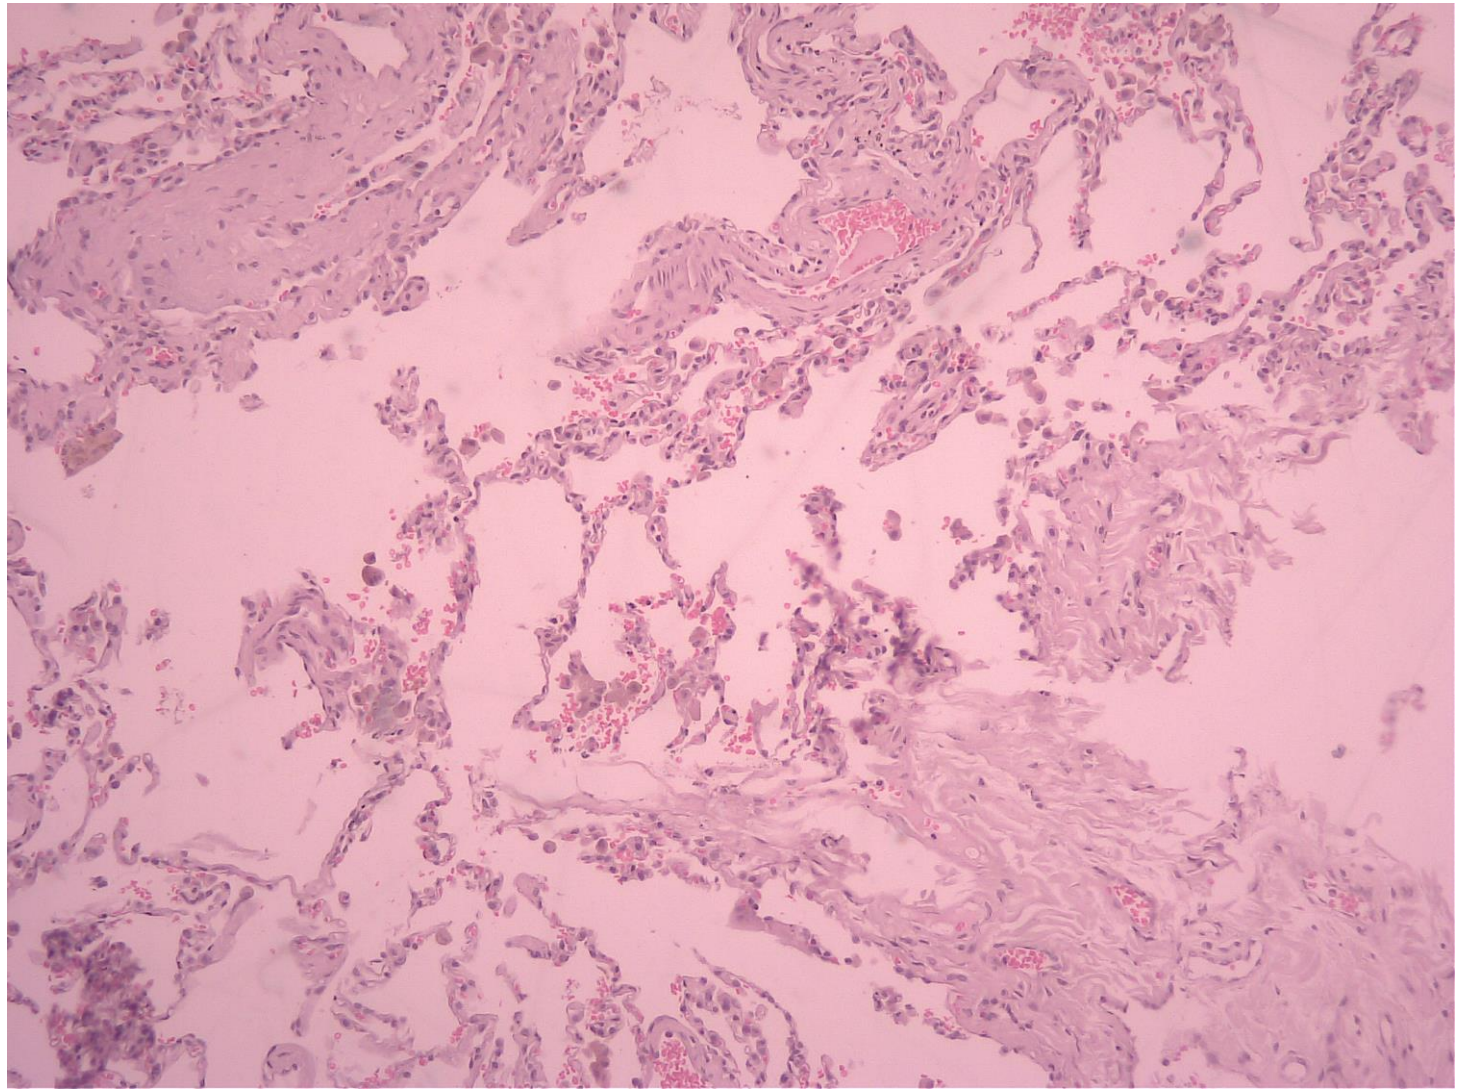

Interpretation of lung biopsy results

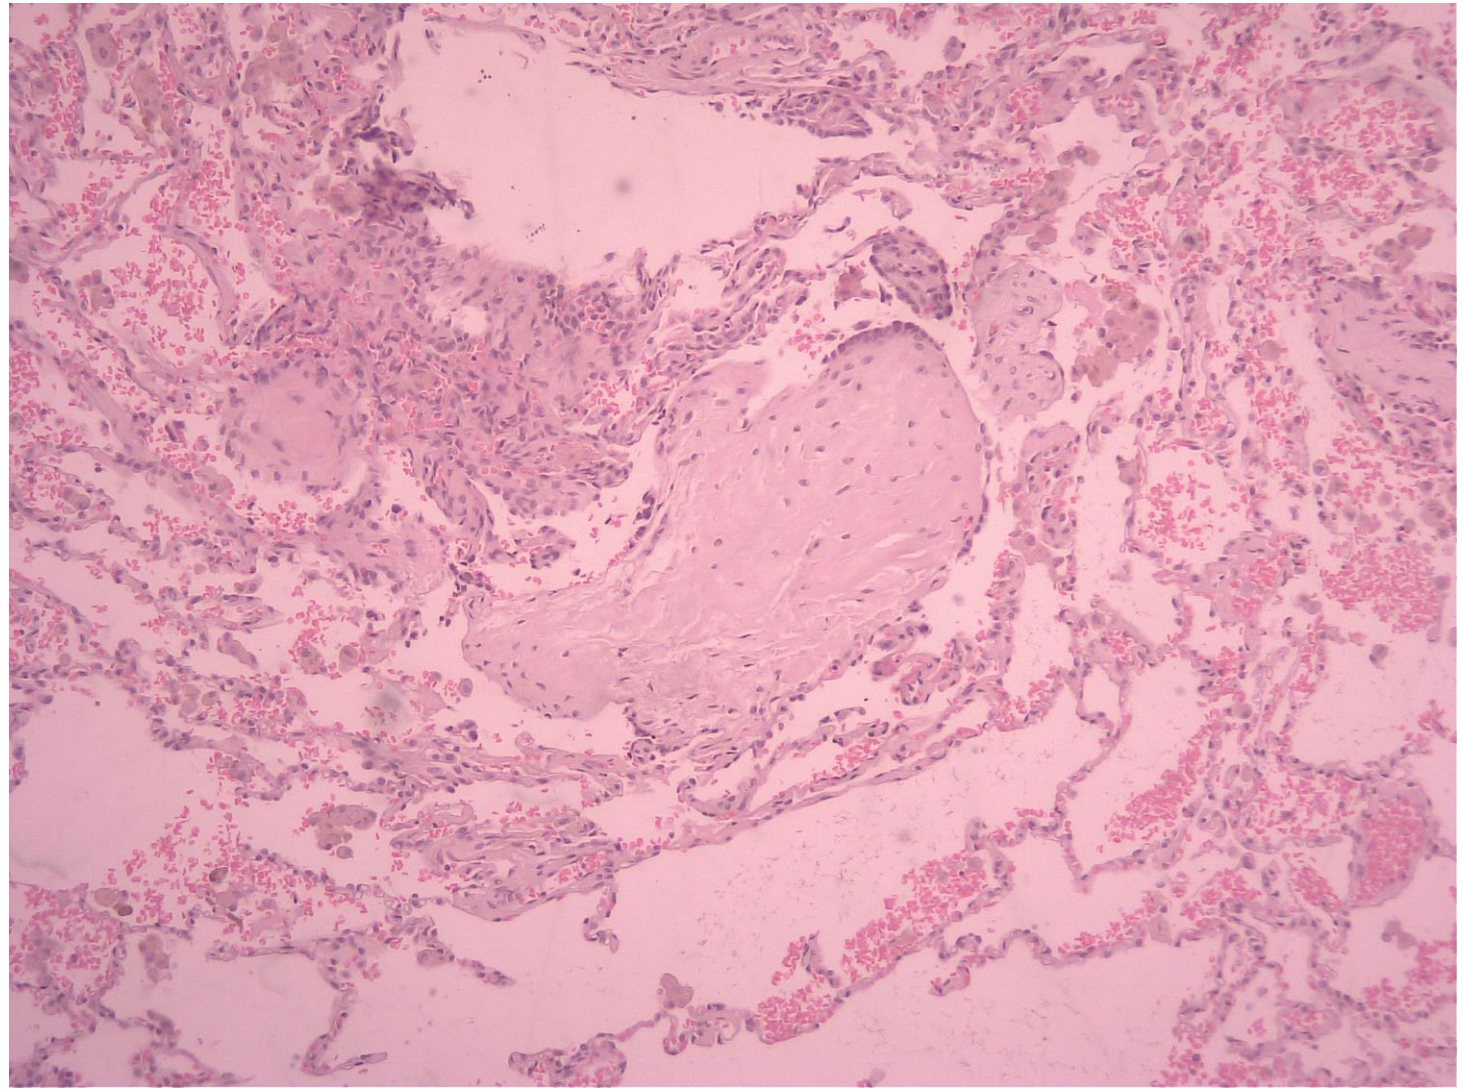

MULTIDISCIPLINARY DISCUSSION

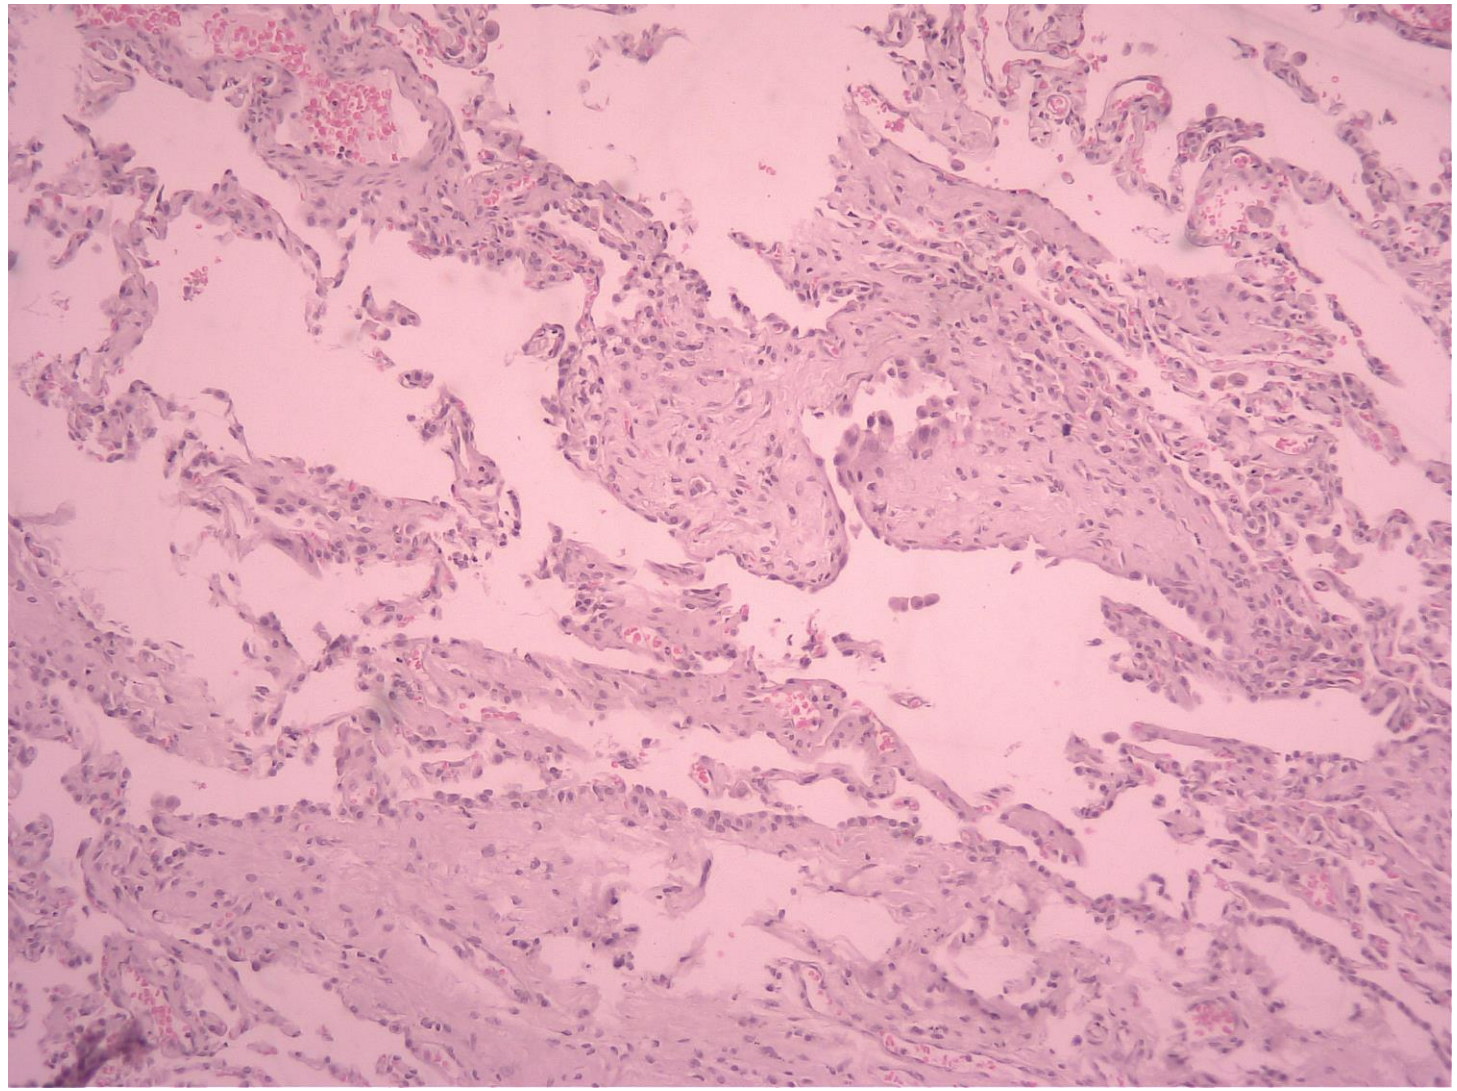

Data provided to the pathologist by the clinician at the time of biopsy

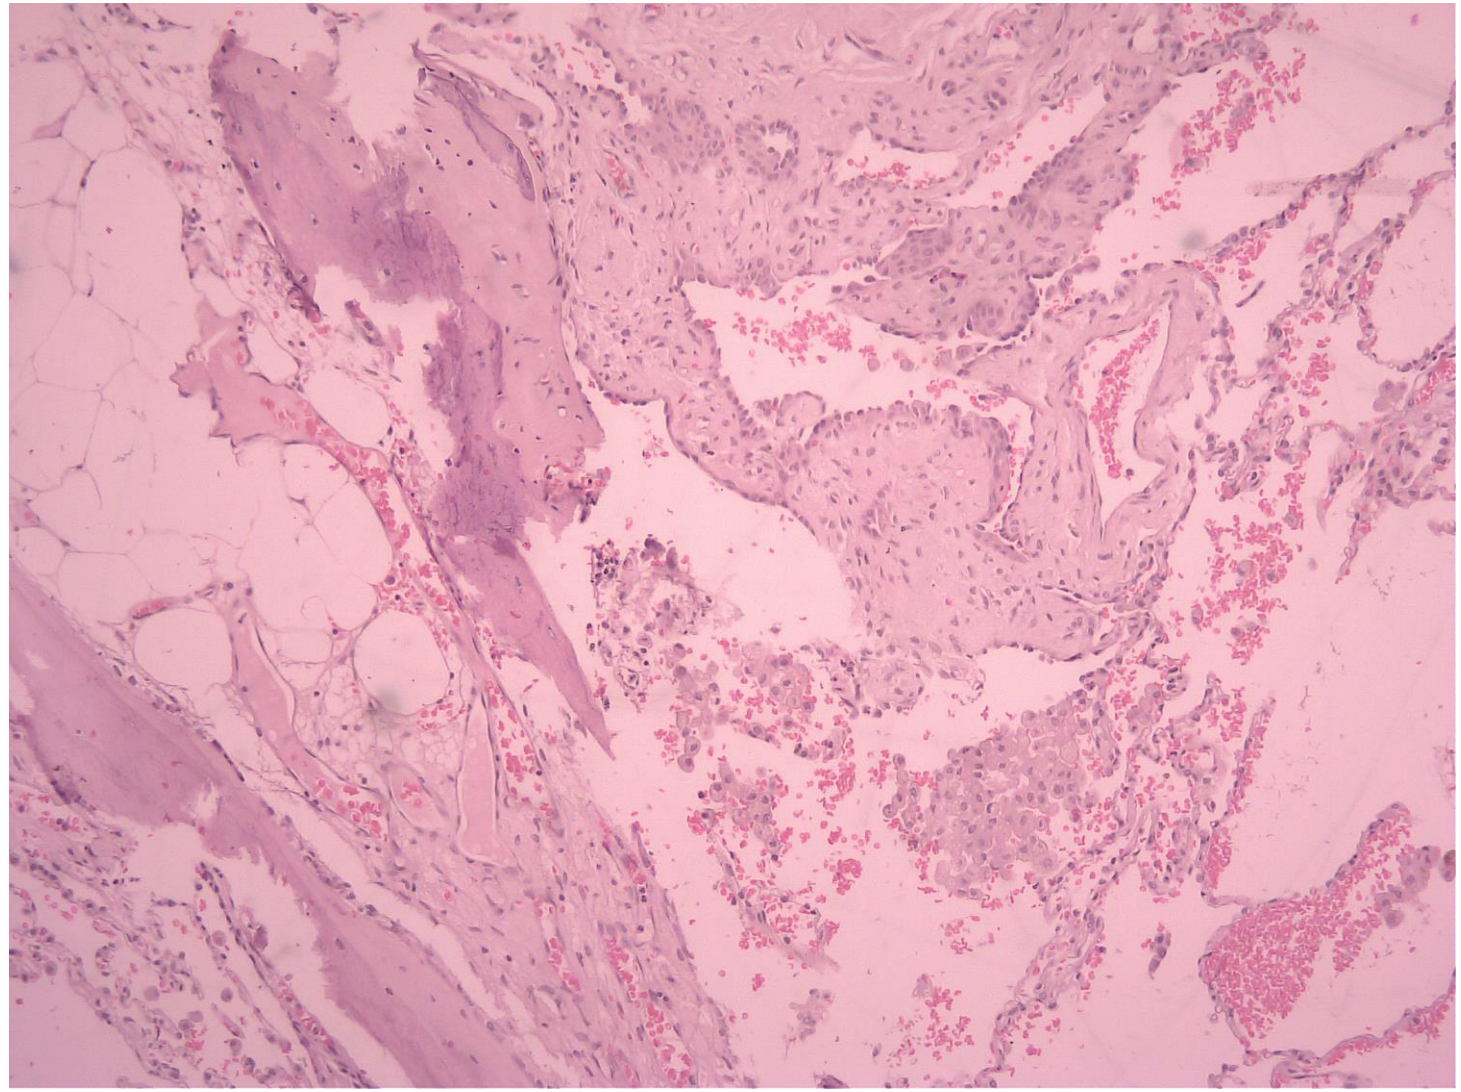

- The age and sex of the patient
- Duration of respiratory illness
- Immunocompetence of the patient
- Smoking history
- History of exposures to occupational or environmental agents (eg, asbestos, beryllium, silica, birds, diisocyanates, humidifier)

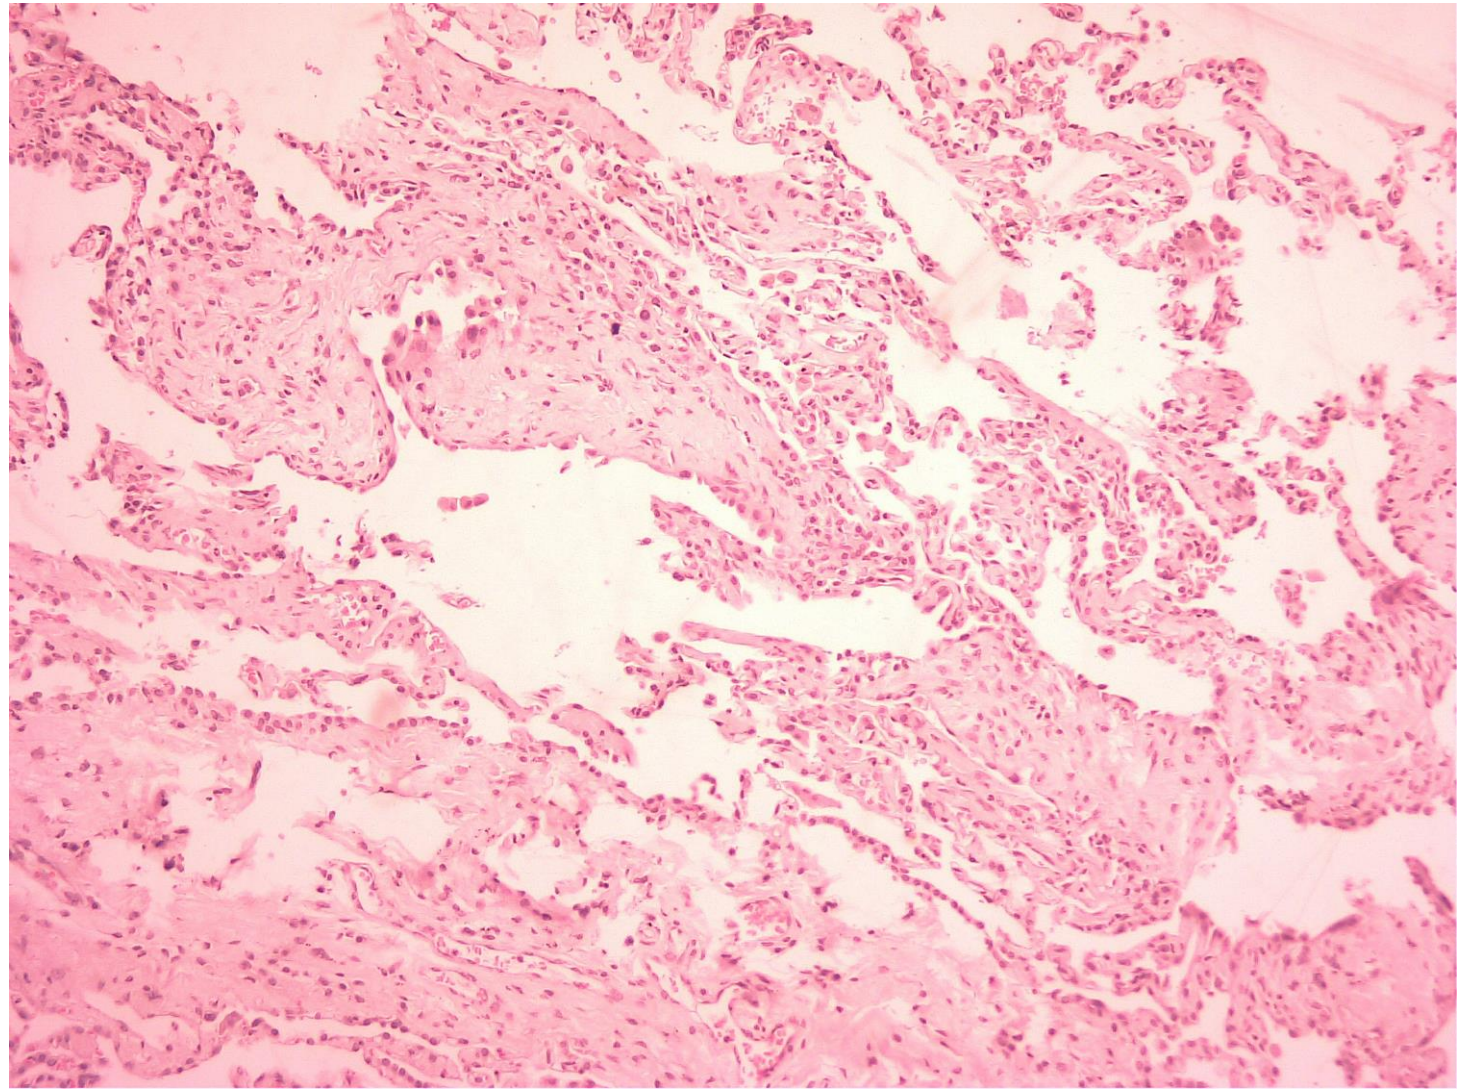

- Evidence for or against underlying connective tissue disease
- Radiographic findings including character, distribution, and time course of abnormalities
- Suspected clinical diagnosis, which will often lead to a more targeted search by the pathologist
- Detailed history of drug use (prescribed or illicit)
